

SEPARATING PEOPLE FROM HAZARDS

New Product Announcement

Kee Klamp® Product Update

Introducing the latest Kee Klamp® fitting - The Oslo Ball

We are expanding the Kee Klamp® range of galvanised fittings to include a new decorative end cap called an "Oslo Ball".

This fitting derives its name from an aesthetic railing feature that is frequently used in Oslo, Norway. The "ball" comes in two sizes and fits onto the end of standard size 7 and size 8 tube.

Part No(s): 32-7 & 32-8

The Oslo Ball end cap attaches to the tube with a standard set screw.

FAQ

How does the Oslo Ball attach?

Like most of our other Kee Klamp® fittings, a set screw can be found on the lower half of the “ball”. Tighten the set screw to secure the ball to the tube.

How much tube should be left exposed at the top of a railing to attach the Oslo Ball?

You should allow at least 37mm of tube at the top of the railing post for the ball to be fitted.

Are there any alternative uses for this fitting?

The primary usage of this fitting is to provide a unique aesthetic, but it can also have a functional use in discouraging skateboarders and other pedestrian traffic from sliding across a railing. Additionally, this fitting can be used as a decorative end for a larger curtain rod made from tube and fittings.

When will the fitting be available?

The fitting is available from Kee Safety Limited now.

For any information and technical support please contact our Sales Team.
